### **PREFACE**

As a cluster administrator, you can configure either automatic or manual upgrade of the OpenShift Al Operator.

### CHAPTER 1. OVERVIEW OF UPGRADING OPENSHIFT AI SELF-MANAGED

As a cluster administrator, you can configure either automatic or manual upgrades for the Red Hat OpenShift AI Operator in a disconnected environment. A disconnected environment is a network restricted environment where Operator Lifecycle Manager (OLM) cannot access the default OperatorHub and image registries, which require Internet connectivity.

- If you configure automatic upgrades, when a new version of the Red Hat OpenShift Al Operator is available, and you have updated your mirror registry content, Operator Lifecycle Manager (OLM) automatically upgrades the running instance of your Operator without human intervention.
- If you configure manual upgrades, when a new version of the Red Hat OpenShift Al Operator is available and you have updated your mirror registry content, OLM creates an update request. A cluster administrator must manually approve the update request to update the Operator to the new version. See Manually approving a pending Operator upgrade for more information about approving a pending Operator upgrade.
- By default, the Red Hat OpenShift AI Operator follows a sequential update process. This means that if there are several minor versions between the current version and the version that you plan to upgrade to, Operator Lifecycle Manager (OLM) upgrades the Operator to each of the minor versions before it upgrades it to the final, target version. If you configure automatic upgrades, OLM automatically upgrades the Operator to the latest available version, without human intervention. If you configure manual upgrades, a cluster administrator must manually approve each sequential update between the current version and the final, target version. Red Hat supports the current version and three previous minor versions of OpenShift AI Self-Managed. For more information, see the Red Hat OpenShift AI Self-Managed Life Cycle knowledgebase article.
- When you upgrade OpenShift AI, you should complete the Requirements for upgrading OpenShift AI.
- If you upgrade to OpenShift AI from version 1 (OpenShift Data Science), follow the guidelines in Cleaning up unused resources from version 1 of Red Hat OpenShift AI (OpenShift Data Science).
- Before you can use an accelerator in OpenShift AI, your instance must have the associated accelerator profile. If your OpenShift Container Platform instance has an accelerator, its accelerator profile is preserved after an upgrade. For more information about accelerators, see Working with accelerators.
- Notebook images are integrated into the image stream during the upgrade and subsequently appear in the OpenShift Al dashboard.

### NOTE

Notebook images are constructed externally; they are prebuilt images that undergo quarterly changes and they do not change with every OpenShift Al upgrade.

#### Additional resources

Operator Lifecycle Manager workflow

### CHAPTER 2. CONFIGURING THE UPGRADE STRATEGY FOR OPENSHIFT AI

As a cluster administrator, you can configure either an automatic or manual upgrade strategy for the Red Hat OpenShift Al Operator.

### **IMPORTANT**

By default, the Red Hat OpenShift Al Operator follows a sequential update process. This means that if there are several versions between the current version and the version that you intend to upgrade to, Operator Lifecycle Manager (OLM) upgrades the Operator to each of the intermediate versions before it upgrades it to the final, target version. If you configure automatic upgrades, OLM automatically upgrades the Operator to the *latest* available version, without human intervention. If you configure manual upgrades, a cluster administrator must manually approve each sequential update between the current version and the final, target version.

For information about supported versions, see Red Hat OpenShift Al Life Cycle.

### **Prerequisites**

- You have cluster administrator privileges for your OpenShift Container Platform cluster.
- The Red Hat OpenShift Al Operator is installed.
- You have mirrored the required container images to a private registry. See Mirroring images to a private registry for a disconnected installation.

### **Procedure**

- 1. Log in to the OpenShift Container Platform cluster web console as a cluster administrator.
- 2. In the Administrator perspective, in the left menu, select Operators → Installed Operators.
- 3. Click the **Red Hat OpenShift AI** Operator.
- 4. Click the Subscription tab.
- 5. Under **Update approval**, click the pencil icon and select one of the following update strategies:
  - Automatic: New updates are installed as soon as they become available.
  - Manual: A cluster administrator must approve any new update before installation begins.
- 6. Click Save.

### Additional resources

- For more information about the subscription channels that are available in version 2 of the Red Hat OpenShift Al Operator, see Installing the Red Hat OpenShift Al Operator.
- For more information about upgrading Operators that have been installed by using OLM, see Updating installed Operators in the OpenShift Container Platform documentation.

### CHAPTER 3. REQUIREMENTS FOR UPGRADING OPENSHIFT AI

This section describes the tasks that you should complete when upgrading OpenShift Al.

### Check the components in the Data Science Cluster object

When you upgrade Red Hat OpenShift AI, the upgrade process automatically uses the values from the previous **DataScienceCluster** object.

After the upgrade, you should inspect the **DataScienceCluster** object and optionally update the status of any components as described in Updating the installation status of Red Hat OpenShift Al components by using the web console.

### Recreate existing pipeline runs

When you upgrade to version 2.6, any existing pipeline runs that you created in the previous version continue to refer to the previous version's image (as expected).

You must delete the pipeline runs (not the pipelines) and create new pipeline runs. The pipeline runs that you create in version 2.6 correctly refer to the version 2.6 image.

For more information on pipeline runs, see Managing pipeline runs.

### Address KServe requirements

For KServe (single-model serving platform), you must meet these requirements:

- Install dependent Operators, including the Red Hat OpenShift Serverless and Red Hat OpenShift Service Mesh Operators. For more information, see Serving large language models.
- After the upgrade, you must inspect the default **DataScienceCluster** object and verify that the value of the **managementState** field for the **kserve** component is **Managed**.
- In Red Hat OpenShift AI version 2.4, the KServe component is a Limited Availability feature. If you enabled the **kserve** component and created models in version 2.4, then after you upgrade to version 2.5, you must update some OpenShift AI resources as follows:
  - 1. Log in as an administrator to the OpenShift Container Platform cluster where OpenShift Al 2.5 is installed:
    - \$ oc login
  - 2. Update the DSC Initialization resource:

\$ oc patch \$(oc get dsci -A -oname) --type='json' -p='[{"op": "replace", "path": "/spec/serviceMesh/managementState", "value":"Unmanaged"}]'

3. Update the **Data Science Cluster** resource:

\$ oc patch \$(oc get dsc -A -oname) --type='json' -p='[{"op": "replace", "path": "/spec/components/kserve/serving/managementState", "value":"Unmanaged"}]'

4. Update the InferenceServices CRD:

 $\$  oc patch crd inferences ervices.serving.kserve.io --type=json -p='[{"op": "remove", "path": "/spec/conversion"}]'

- 5. Optionally, restart the Operator pod.

  For more information about these configurations, see Installing KServe.
- If you deployed a model by using KServe in OpenShift AI version 2.4, when you upgrade to version 2.5 the model does not automatically appear in the OpenShift AI dashboard. To update the dashboard view, redeploy the model by using the OpenShift AI dashboard.

# CHAPTER 4. CLEANING UP UNUSED RESOURCES FROM VERSION 1 OF RED HAT OPENSHIFT AI (OPENSHIFT DATA SCIENCE)

Version 1 of OpenShift AI (previously OpenShift Data Science) created a set of Kubeflow Deployment Definition (that is, **KfDef**) custom resource instances on your OpenShift Container Platform cluster for various components of OpenShift AI. When you upgrade to version 2, these resources are no longer used and require manual removal from your cluster. The following procedures shows how to remove unused **KfDef** instances from your cluster by using both the OpenShift command-line interface (CLI) and the web console.

### 4.1. REMOVING UNUSED RESOURCES BY USING THE CLI

The following procedure shows how to remove unused **KfDef** instances from the **redhat-ods-applications**, **redhat-ods-monitoring**, and **rhods-notebooks** projects in your OpenShift Container Platform cluster by using the OpenShift command-line interface (CLI). These resources become unused after you upgrade from version 1 to version 2 of OpenShift AI.

### **Prerequisites**

- You upgraded from version 1 to version 2 of OpenShift Al.
- You have cluster administrator privileges for your OpenShift Container Platform cluster.

#### **Procedure**

- 1. Open a new terminal window.
- 2. In the OpenShift command-line interface (CLI), log in to your on your OpenShift Container Platform cluster as a cluster administrator, as shown in the following example:
  - \$ oc login <openshift\_cluster\_url> -u system:admin
- 3. Delete any KfDef instances that exist in the redhat-ods-applications project.
  - \$ oc delete kfdef --all -n redhat-ods-applications --ignore-not-found || true

For any **KfDef** instance that is deleted, the output is similar to the following example:

kfdef.kfdef.apps.kubeflow.org "rhods-dashboard" deleted

### TIP

If deletion of a **KfDef** instance fails to finish, you can force deletion of the object using the information in the "Force individual object removal when it has finalizers" section of the following Red Hat solution article: https://access.redhat.com/solutions/4165791.

4. Delete any **KfDef** instances in the **redhat-ods-monitoring** and **rhods-notebooks** projects by entering the following commands:

\$ oc delete kfdef --all -n redhat-ods-monitoring --ignore-not-found || true \$ oc delete kfdef --all -n rhods-notebooks --ignore-not-found || true

### Verification

 Check whether all KfDef instances have been removed from the redhat-ods-applications, redhat-ods-monitoring, and rhods-notebooks projects.

\$ oc get kfdef --all-namespaces

Verify that you see no **KfDef** instances listed in the **redhat-ods-applications**, **redhat-ods-monitoring**, or **rhods-notebooks** projects.

### 4.2. REMOVING UNUSED RESOURCES BY USING THE WEB CONSOLE

The following procedure shows how to remove unused **KfDef** instances from the **redhat-ods-applications**, **redhat-ods-monitoring**, and **rhods-notebooks** projects in your OpenShift Container Platform cluster by using the OpenShift web console. These resources become unused after you upgrade from version 1 to version 2 of OpenShift Al.

### **Prerequisites**

- You upgraded from version 1 to version 2 of OpenShift Al.
- You have cluster administrator privileges for your OpenShift Container Platform cluster.

### **Procedure**

- 1. Log in to the OpenShift Container Platform web console as a cluster administrator.
- 2. In the web console, click **Administration** → **CustomResourceDefinitions**.
- 3. On the CustomResourceDefinitions page, click the KfDef custom resource definition (CRD).
- Click the **Instances** tab.
   The page shows all **KfDef** instances on the cluster.
- 5. Take note of any **KfDef** instances that exist in the **redhat-ods-applications**, **redhat-ods-monitoring**, and **rhods-notebooks** projects. These are the projects that you will clean up in the remainder of this procedure.
- 6. To delete a **KfDef** instance from the **redhat-ods-applications**, **redhat-ods-monitoring**, or **rhods-notebooks** project, click the action menu (:) beside the instance and select **Delete KfDef** from the list.
- 7. To confirm deletion of the instance, click **Delete**.

### TIP

If deletion of a **KfDef** instance fails to finish, you can force deletion of the object using the information in the "Force individual object removal when it has finalizers" section of the following Red Hat solution article: https://access.redhat.com/solutions/4165791.

8. Repeat the preceding steps to delete all remaining **KfDef** instances that you see in the **redhat-ods-applications**, **redhat-ods-monitoring**, and **rhods-notebooks** projects.
